

Risk Neutral: Poised to Go Either Way in Short-Term BULL MARKET STILL IN TACT, IN OUR VIEW

In the last few months we have cut back the equity weightings in our balanced accounts to neutral primarily through a significant reduction in developed international stocks, even though our strategic process suggests better long-term returns from international stocks. The reductions are part of our risk management process and have been driven by two main factors, the escalation of tariffs and the underperformance of non-US markets. For the reasons outlined below, we expect to re-invest in stocks, but we regard the risk of a further escalation of tariffs as sufficient to warrant caution at present. However, the following charts support our opinion that the structural bull market is still intact.

MARKET-PEAK WATCH: A CHECKLIST

While market corrections are commonplace, the end of a secular bull market is a rare event. Structural, multi-year stock market peaks – the likes of which we witnessed in 2000 and 2007- are usually marked by one or more of a combination of the following conditions, in our opinion.

- THREAT OF IMMINENT RECESSION
- OVERLY RESTRICTIVE MONETARY POLICY
- EXCESSIVE VALUATION
- EXTERNAL SHOCK

No Recession in Sight: Economic Surveys and Earnings Revisions Remain Positive

Earnings momentum (blue line - *the net number of positive analyst earnings-per-share estimate revisions, divided by the total number of estimates*) for the S&P 500 index recently reached levels of positive momentum that we haven't seen in over a decade.

We think this momentum is related to positive economic fundamentals - as demonstrated by the ISM manufacturing survey (dotted green line), as well as corporate tax reform. **In looking at the behavior of the ISM survey and earnings revisions around past recessionary periods in the US (shaded regions), it is difficult for us to foresee an imminent recession.**

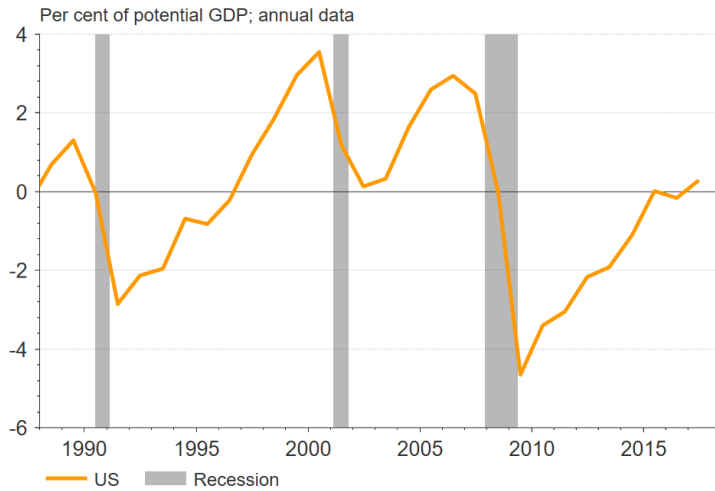

No Recession in Sight Yet: US Economy Not Overheated

When actual Gross Domestic Product (GDP) is meaningfully higher than potential GDP, an output gap is created. The output gap (orange line) represents the difference between an economy's actual output versus its potential long-term output given its natural rate of unemployment.

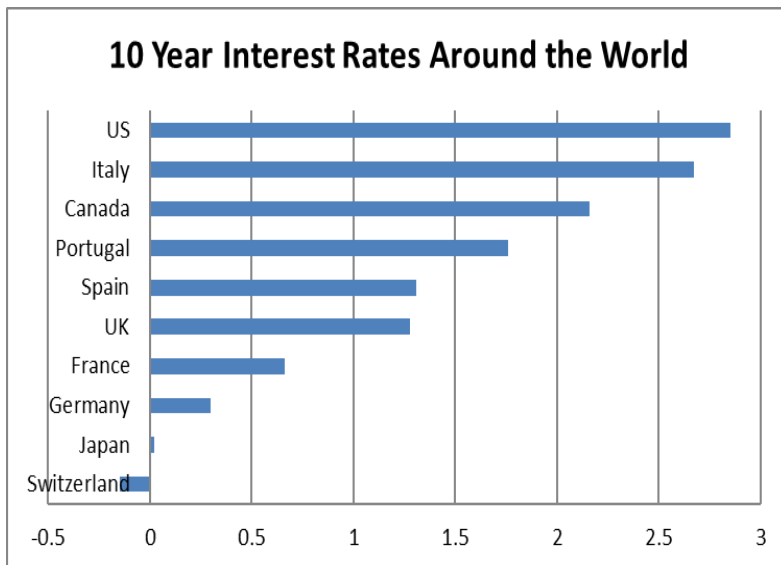

A large output gap suggests the economy is 'overheating,' leading to inflation... and, with a lag, recession. We believe an overheated and declining output gap tends to lead recessions (shaded regions) by an average of more than 2 years.

As the chart pattern suggests, despite 8 straight years of recovery, the US economy is not yet 'overheated' and therefore recession risk appears low to us for now.

Output gap (Actual GDP minus potential GDP)

10 Year Interest Rates Around the World

Valuations not Excessive, In Our View

The chart on the right shows historical operating Price-Earnings (P/E) ratios for the S&P 500 in different 10-year bond yield environments. The black bar indicates the range of observations and the average is depicted by the blue triangle.

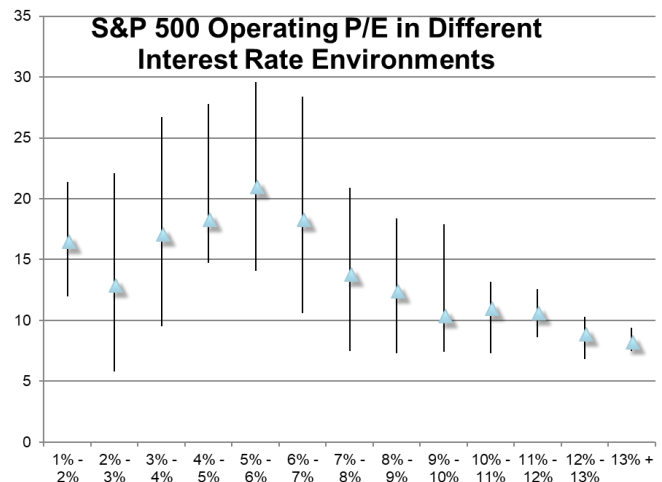

Historically, as growth has recovered, and yields moved higher, the S&P 500's P/E has risen until investors begin to anticipate the next downturn in earnings. We expect continued earnings growth in 2018.

The S&P's current 21x Operating P/E is at the upper end of the 15x – 21x range typical for 2-3% interest rate environments and near the middle of the 10x - 26x range for 3-4% rate environments.

Monetary Policy Supportive

Interest Rates remain below 3% throughout the developed world. Low interest rates have historically been stimulative to economies because they encourage capital expenditures, hiring, investing and discretionary spending while discouraging savings.

Going forward, global Central Banks expect to keep monetary conditions relatively loose. They have noted that recent hikes in short-term interest rates and reductions in money printing programs were to remove 'excessive accommodation' and not to 'put the brakes' on their economies.

External Shock: US and China's Trade Relationship in Focus

While we believe that protectionist trade policies, if fully executed, are a 'lose-lose' proposition, we are not yet convinced that the US and China are headed there - despite aggressive rhetoric from both sides.

Rather, we view both the US and China's rhetoric as designed for maximum political effect. Behind the bluster, the world's largest and second largest economies need each other— at least for the time being. Each country is the other's largest trade partner; ~\$600B total in trade.

We believe our current trade dynamic with China warrants a rethink. China routinely

shows lack of respect for intellectual property, and, as the chart above shows, levies tariff rates on imports that are among the most severe among large economies.

Accordingly, these materials are not intended to cause RiverFront Investment Group, LLC or an affiliate to become a fiduciary within the meaning of Section 3(21)(A)(ii) of the Employee Retirement Income Security Act of 1974, as amended or Section 4975(e)(3)(B) of the Internal Revenue Code of 1986, as amended.

When referring to being "overweight" or "underweight" relative to a market or asset class, RiverFront is referring to our current portfolios' weightings compared with the composite benchmarks for each portfolio

Equities/Stocks represent partial ownership of a corporation. If the corporation does well, its value increases, and investors share in the appreciation. However, if it goes bankrupt, or performs poorly, investors can lose their entire initial investment (i.e., the stock price can go to zero).

Fixed Income/Bonds represent a loan made by an investor to a corporation or government. As such, the investor gets a guaranteed interest rate for a specific period of time and expects to get their original investment back at the end of that time period, along with the interest earned. Investment risk is repayment of the principal (amount invested). In the event of a bankruptcy or other corporate disruption, bonds are senior to stocks. Investors should be aware of these differences prior to investing.

Investing in foreign companies poses additional risks since political and economic events unique to a country or region may affect those markets and their issuers. In addition to such general international risks, the portfolio may also be exposed to currency fluctuation risks and emerging markets risks as described further below.

Changes in the value of foreign currencies compared to the U.S. dollar may affect (positively or negatively) the value of the portfolio's investments. Such currency movements may occur separately from, and/or in response to, events that do not otherwise affect the value of the security in the issuer's home country. Also, the value of the portfolio may be influenced by currency exchange control regulations. The currencies of emerging market countries may experience significant declines against the U.S. dollar, and devaluation may occur subsequent to investments in these currencies by the portfolio.

Foreign investments, especially investments in emerging markets, can be riskier and more volatile than investments in the U.S. and are considered speculative and subject to heightened risks in addition to the general risks of investing in non-U.S. securities. Also, inflation and rapid fluctuations in inflation rates have had, and may continue to have, negative effects on the economies and securities markets of certain emerging market countries.

In a rising interest rate environment, the value of fixed-income securities generally declines.

Technical analysis is based on the study of historical price movements and past trend patterns. There are no assurances that movements or trends can or will be duplicated in the future.

Price/earnings ratio (often shortened to the P/E ratio) is the ratio of a company's stock price to the company's earnings per share.

Index Definitions

Standard & Poor's 500 Index (S&P 500) measures the performance of 500 large cap stocks, which together represent about 80% of the total US equities market. It is not possible to invest directly in an index.
